Windows 7 x4 is the latest operating system designed by Microsoft and is their most secure operating system ever. Microsoft Windows 7 has many improvements over previous versions of Windows, but they've been available in a 64 bit version since Vista 64 bit. Microsoft has incorporated a number of new features in Windows 7 64 Bit to improve security, performance and stability. Windows 7 64 Bit is a good operating system that comes with both integrated and add-on security features that enable it to be run in a secure environment. The User Account Control (UAC) technology in Windows 7 will alert users that any elevated command line or program that runs with administrator privileges can change their settings without receiving notification. The Windows Update service in Windows 7 uses the Enhanced Error Reporting (EER) to provide more information about errors and to identify files that cause problems when they are installed. The Data Execution Prevention (DEP) will prevent harmful code from being installed in the operating system, ensuring security for all programs and data. Windows 7 Application Compatibility Software has been built into this operating system to help determine command line compatibility between various software products. This compatibility analysis will help determine the impact of upgrading an application or a Windows 7 operating system on applications or systems. Other security technologies in Windows 7 64 Bit include: Windows Defender is a security tool that will provide basic protection from viruses, spyware and other malicious software. It can identify and quarantine infected files that may have been downloaded. It has an automated updating capability that ensures protection against the latest malicious software. Make sure you have a good anti virus program on your computer before downloading any files from this Microsoft site. The Windows Firewall with Advanced Security in this operating system provides enhanced security for networks by using Network Access Protection (NAP) to control incoming traffic based on whether the device is compliant with network access policies. It also allows administrators to control the traffic through the firewall. Windows Update uses the Enhanced Error Reporting (EER) to provide information about errors that occur when Windows 7 is installed or an update is installed. This feature will help to troubleshoot problems that arise after installing an update, so you can fix them right away before they become a problem. Open Security features in Windows 7 64 Bit uses authentication technology to protect access to network resources, including Active Directory domain controllers and file shares, without having to use passwords for security credentials. The latest version of Windows 7 has also been built with improved digital certificates based on Microsoft's Root Certificate Program, which makes your system more secure from malicious certificates used by hackers and malware.
